

VBScript Working with Folders

Here is an example I created to refer to whenever I am working with folders in VBScript, the Scripting.FileSystemObject object has a lot of useful methods. In the example below I make use of the following methods:

1. FolderExists

1. http://www.w3schools.com/asp/met_folderexists.asp

2. CreateFolder

1. http://www.w3schools.com/asp/met_createfolder.asp

3. CopyFolder

1. http://www.w3schools.com/asp/met_copyfolder.asp

The example below creates a folder called test and then copies it to copyOfTest.

```
Dim objFSO, folderFound

Set objFSO = CreateObject("Scripting.FileSystemObject")
folderFound = False

'// Checking if a folder Exists
If objFSO.FolderExists("./test") = True Then
    folderFound = True
End If

'// Creating a folder
If folderFound = False Then
    objFSO.CreateFolder("./test")
End If

'// Copying a folder
If objFSO.FolderExists("./test") = True Then
    objFSO.CopyFolder "./test", "./copyOfTest"
End If
```
