

VBScript Copy a File

Copying files with VBScript is simple as source, destination. To copy a text file we make use of the CopyFile source,destination[,overwrite] method (http://www.w3schools.com/asp/met_copyfile.asp).

The following parameters are given to the method:

- Source – string – The source file
- Destination – string – The destination
- Overwrite – bool – overwrite the destination file if exists

The following code will copy a file:

```
Dim fso, aFile
Set fso = CreateObject("Scripting.FileSystemObject")

'// Create a dummy file if we dont have one to copy
Set aFile = fso.CreateTextFile("./original.txt", TRUE)
aFile.WriteLine("This is a dummy file")

'// Copy the file
fso.CopyFile "./original.txt", "./copy.txt"

Set fso = Nothing
```
