Wireless Networking on Server 2008 R2

I have been playing around with Server 2008 R2, and was struggling to get my wireless network working. I had gone through all the usual steps along with getting the drivers from the web, hitting the PC and fiddling around with the adapter settings.

Turns out that the Wireless service is disabled on 2008 (for security) and you need to add the role to the server. This is the blog post that saved my sanity
